

# AI Assistant Coding

## Assignment 6.3

Name: K. RUCHITHA HT. No: 2303A52069

Batch: 32

**Q1.** Task: Prompt AI to generate a function that displays all Automorphic numbers between 1 and 1000 using a for loop.

Instructions:

- o Get AI-generated code to list Automorphic numbers using a for loop.
- o Analyze the correctness and efficiency of the generated logic.
- o Ask AI to regenerate using a while loop and compare both implementations

```
Task1.py > ...
1  """
2  1.write a python function that genartes automorphic numbers within range from 1 to 1000. using for loop
3  """
4  import time
5
6
7  def is_automorphic(num):
8      square = num ** 2
9      return str(square).endswith(str(num))
10 def generate_automorphic_numbers(start, end):
11     automorphic_numbers = []
12     for num in range(start, end + 1):
13         if is_automorphic(num):
14             automorphic_numbers.append(num)
15     return automorphic_numbers
16 t1 = time.time()
17 automorphic_numbers = generate_automorphic_numbers(1, 1000)
18 print("Time taken using for loop:", time.time() - t1)
19 print("Automorphic numbers between 1 and 1000 are:", automorphic_numbers)
20
```

```
...
2.write a python function that genartes automorphic numbers within range from 1 to 1000. using while loop
...
def generate_automorphic_numbers_while(start, end):
    automorphic_numbers = []
    num = start
    while num <= end:
        if is_automorphic(num):
            automorphic_numbers.append(num)
        num += 1
    return automorphic_numbers
t2 = time.time()
automorphic_numbers_while = generate_automorphic_numbers_while(1, 1000)
print("Time taken using while loop:", time.time() - t2)
print("Automorphic numbers between 1 and 1000 using while loop are:", automorphic_numbers_while)
```

```

● PS D:\Course\AIAC\28-1-2026> & C:/Python314/python.exe d:/Course/AIAC/28-1-2026/Task1.py
Time taken using for loop: 0.0004050731658935547
Automorphic numbers between 1 and 1000 are: [1, 5, 6, 25, 76, 376, 625]
Time taken using while loop: 0.0004239082336425781
Automorphic numbers between 1 and 1000 using while loop are: [1, 5, 6, 25, 76, 376, 625]
○ PS D:\Course\AIAC\28-1-2026> 

```

### Explanation:

For loop is the best because it takes less time. Use for loop when you know when to stop if not use while loop.

**Q2. Task: Ask AI to write nested if-elif-else conditions to classify online shopping feedback as Positive, Neutral, or Negative based on a numerical rating (1–5).**

- **Instructions:**

- o Generate initial code using nested if-elif-else.

- o Analyze correctness and readability.

- o Ask AI to rewrite using dictionary-based or match-case

**input:**

```

Task2.py > classify_feedback_dict
1  import time
2  #write a python funtuion that classify online shopping feedback into positive, negative and neutral based
  #on numerical rating (1-5) using nested if-elif-else statements.
3  def classify_feedback(rating):
4      if rating >= 1 and rating <= 5:
5          if rating >= 4:
6              return "Positive"
7          elif rating == 3:
8              return "Neutral"
9          else:
10             return "Negative"
11     else:
12         return "Invalid rating. Please provide a rating between 1 and 5."
13 # Example usage:
14 t1 = time.time()
15 print(classify_feedback(5))
16 print("Time taken usning if-elif-else statements:", time.time() - t1) # Output: Positive
17 print(classify_feedback(3)) # Output: Neutral
18 print(classify_feedback(1)) # Output: Negative
19 print(classify_feedback(6)) # Output: Invalid rating. Please provide a rating between 1 and 5.
20
21
22
23
24

```

```

print("\n")
#write a python function that classify online shopping feedback into positive, negative and neutral based
on numerical rating (1-5) using dictionary or match case.
def classify_feedback_dict(rating):
    feedback_dict = {
        5: "Positive",
        4: "Positive",
        3: "Neutral",
        2: "Negative",
        1: "Negative"
    }
    return feedback_dict.get(rating, "Invalid rating. Please provide a rating between 1 and 5.")
# Example usage:
t2 = time.time()
print(classify_feedback_dict(5))
print("Time taken using dictionary or match case:", time.time() - t2) # Output: Positive
print(classify_feedback_dict(3)) # Output: Neutral
print(classify_feedback_dict(1)) # Output: Negative
print(classify_feedback_dict(6)) # Output: Invalid rating. Please provide a rating between 1 and 5.

```

Output:

```

PS D:\Course\AIAC\28-1-2026> & C:/Python314/python.exe d:/Course/AIAC/28-1-2026/Task2.py
● Positive
Time taken using if-elif-else statements: 0.00010204315185546875
Neutral
Negative
Invalid rating. Please provide a rating between 1 and 5.

Positive
Time taken using dictionary or match case: 3.743171691894531e-05
Neutral
Negative
Invalid rating. Please provide a rating between 1 and 5.
○ PS D:\Course\AIAC\28-1-2026>

```

**Explanation:**

The Condition ensures the correctness of the code. Dictionary improves readability

---

### Q3. Task 3: Statistical\_operations

Define a function named `statistical_operations(tuple_num)` that performs the following statistical operations on a tuple of numbers:

- Minimum, Maximum
- Mean, Median, Mode

- Variance, Standard Deviation

While writing the function, observe the code suggestions provided by GitHub Copilot. Make decisions to accept, reject, or modify the suggestions based on their relevance and correctness

```
Task3.py Task2.py
28-1-2026 > Task3.py > ...
1  """
2  1. write a python function nsume statistical_operation(tuple_numm) and perform Minimum, maximum, mean,
3  | median, mode, variance and standard deviation.
4  """
5  import statistics
6  def statistical_operation(tuple_numm):
7      if len(tuple_numm) == 0:
8          return "The tuple is empty. Please provide a tuple with numerical values."
9
10     minimum = min(tuple_numm)
11     maximum = max(tuple_numm)
12     mean = statistics.mean(tuple_numm)
13     median = statistics.median(tuple_numm)
14     try:
15         mode = statistics.mode(tuple_numm)
16     except statistics.StatisticsError:
17         mode = "No unique mode found"
18     variance = statistics.variance(tuple_numm)
19     std_deviation = statistics.stdev(tuple_numm)
20
21     return {
22         "Minimum": minimum,
23         "Maximum": maximum,
24         "Mean": mean,
25         "Median": median,
26         "Mode": mode,
27         "Variance": variance,
28         "Standard Deviation": std_deviation
29     }
30 # Example usage:
31 data = (1, 2, 2, 3, 4, 5, 5, 5)
32 result = statistical_operation(data)
33 for key, value in result.items():
34     print(f"{key}: {value}")
35
```

## Q5. Task #5 – Zero-Shot Prompting with Conditional Validation

Use zero-shot prompting to instruct an AI tool to generate a function that validates an Indian mobile number.

### Requirements

- The function must ensure the mobile number:
  - o Starts with 6, 7, 8, or 9
  - o Contains exactly 10 digits

### Expected Output

- A valid Python function that performs all required validations without using any input-output examples in the prompt

```
Task5.py X
28-1-2026 > Task5.py > ...
1  '''
2  write a python function name vaild indian number and check number starts with 6 7 8 9
3  and length is 10 digit
4  '''
5  def vaild_indian_number(number):
6      if len(number) == 10 and number[0] in '6789' and number.isdigit():
7          return True
8      return False
9  print(vaild_indian_number("9876543210")) # True
10 print(vaild_indian_number("1234567890")) # False
11
```

Output:

```
(AIAC_env) PS D:\Course\AIAC> & D:/Course/AIAC/AIAC_env/Scripts/python.exe d:/Course/AIAC/28-1-2026/Task5.py
True
False

### Q6. Task Description #6 (Loops – Armstrong Numbers in a Range)

Task: Write a function using AI that finds all Armstrong numbers in a user-specified range (e.g., 1 to 1000).

### Instructions:

- Use a for loop and digit power logic.
- Validate correctness by checking known Armstrong numbers (153, 370,

etc.).

- Ask AI to regenerate an optimized version (using list comprehensions).

Expected Output #7:

- Python program listing Armstrong numbers in the range.
- Optimized version with explanation

```
28-1-2026 > Task6.py > ...
1  '''
2  write a python function that finds armstrong numbers from 1 to 1000
3  using for loop and digit power logic.
4  '''
5  def find_armstrong_numbers():
6      armstrong_numbers = []
7      for num in range(1, 1001):
8          # Convert number to string to easily iterate over digits
9          digits = str(num)
10         num_digits = len(digits)
11         sum_of_powers = sum(int(digit) ** num_digits for digit in digits)
12
13         if sum_of_powers == num:
14             armstrong_numbers.append(num)
15
16     return armstrong_numbers
17 # Example usage
18 armstrong_numbers = find_armstrong_numbers()
19 print("Armstrong numbers from 1 to 1000:", armstrong_numbers)
```

```
'''
write a python function that finds armstrong numbers from 1 to 1000
using for loop and digit power logic. optimized version using list comprehension
'''
def find_armstrong_numbers_optimized():
    return [num for num in range(1, 1001) if sum(int(digit) ** len(str(num)) for digit in str(num)) == num]
# Example usage
armstrong_numbers_optimized = find_armstrong_numbers_optimized()
print("Armstrong numbers from 1 to 1000 (optimized):", armstrong_numbers_optimized)
```

Output:

```
PROBLEMS OUTPUT PORTS DEBUG CONSOLE TERMINAL
PS D:\Course\AIAC> & D:/Course/AIAC/AIAC_env/Scripts/Activate.ps1
(AIAC_env) PS D:\Course\AIAC> & D:/Course/AIAC/AIAC_env/Scripts/python.exe d:/Course/AIAC/28-1-2026/Task6.py
Armstrong numbers from 1 to 1000: [1, 2, 3, 4, 5, 6, 7, 8, 9, 153, 370, 371, 407]
Armstrong numbers from 1 to 1000 (optimized): [1, 2, 3, 4, 5, 6, 7, 8, 9, 153, 370, 371, 407]
(AIAC_env) PS D:\Course\AIAC>
```

Explanation:

By Using for loop it is easy to understand and debug the code best for beginner.  
while List comprehension is minimal and hard to debug

---

### **Q7. Task Description #7 (Loops – Happy Numbers in a Range)**

**Task: Generate a function using AI that displays all Happy Numbers within a user-specified range (e.g., 1 to 500).**

**Instructions:**

- **Implement the logic using a loop: repeatedly replace a number with the sum of the squares of its digits until the result is either 1 (Happy Number) or enters a cycle (Not Happy).**
- **Validate correctness by checking known Happy Numbers (e.g., 1, 7, 10, 13, 19, 23, 28...).**
- **Ask AI to regenerate an optimized version (e.g., by using a set to detect cycles instead of infinite loops).**

**Expected Output #8:**

- **Python program that prints all Happy Numbers within a range.**
- **Optimized version using cycle detection with explanation.**

```

2  write a python function  to display all happnnumbers in rnage 1 to 500
3  ...
4  import time
5
6
7  def is_happy_number(n):
8      seen = set()
9      while n != 1 and n not in seen:
10         seen.add(n)

(AIAC_env) PS D:\Course\AIAC>
```

## Explanation:

The optimized cycle detection method is the best choice because it reduces memory usage, improves efficiency, and scales better while still producing correct results. The set-based approach is easier for beginners, but the optimized method is more professional and performance-oriented.

## Q8. Task Description #8 (Loops – Strong Numbers in a Range)

**Task:** Generate a function using AI that displays all Strong Numbers (sum of factorial of digits equals the number, e.g.,  $145 = 1! + 4! + 5!$ ) within a given range.

### Instructions:

- Use loops to extract digits and calculate factorials.
- Validate with examples (1, 2, 145).
- Ask AI to regenerate an optimized version (precompute digit factorials).

### Expected Output #9:

- Python program that lists Strong Numbers.
- Optimized version with explanation.

```
task8.py x

● Time taken: 0.0006704330444335938 seconds
  Strong numbers between 1 and 500: [1, 2, 145]
  Time taken (optimized): 0.00022077560424804688 seconds
  Strong numbers between 1 and 500 (optimized): [1, 2, 145]
○ (AIAC_env) PS D:\Course\AIAC>

```

## Explanation:

The basic approach identifies strong numbers correctly but recalculates factorials repeatedly, leading to unnecessary computation.

The optimized method precomputes factorials of digits (0–9), reducing repeated calculations and improving efficiency.

Hence, the optimized approach is more suitable for larger ranges due to better performance and scalability.

## Q9. Task #9 – Few-Shot Prompting for Nested Dictionary Extraction

### Objective

Use few-shot prompting (2–3 examples) to instruct the AI to create a function that parses a nested dictionary representing student information.

### Requirements

- The function should extract and return:

- o Full Name

- o Branch

- o SGPA

### Expected Output

A reusable Python function that correctly navigates and extracts values from nested dictionaries based on the provided examples

```
20 1 2020 7  tasks.py 7 ...
1  '''
2  write a python function that parses a nested dictionary of student
   information Requirements:
3  Full Name
4  o Branch
5  o SGPA
6
7  example input:
8  | "full_name": "Alice Johnson",
9  |         | "branch": "Computer Science",
10 |         | "sgpa": 8.5
11 |         | full_name": "Bob Smith",
12 |         | "branch": "Mechanical Engineering",
13 |         | "sgpa": 7.8
14  '''
```

```

15 def parse_student_info(students):
16     parsed_info = []
17     for student_id, info in students.items():
18         student_data = {
19             "Full Name": info.get("full_name"),
20             "Branch": info.get("branch"),
21             "SGPA": info.get("sgpa")
22         }
23         parsed_info.append(student_data)
24     return parsed_info
25 # Example usage
26 students = {
27     "student_1": {
28         "full_name": "Alice Johnson",
29         "branch": "Computer Science",
30         "sgpa": 8.5
31     },
32     "student_2": {
33         "full_name": "Bob Smith",
34         "branch": "Mechanical Engineering",
35         "sgpa": 7.8
36     },
37     "student_3": {
38         "full_name": "Charlie Brown",
39         "branch": "Electrical Engineering",
40         "sgpa": 9.1
41     }
42 }
43 parsed_students = parse_student_info(students)
44 for student in parsed_students:
45     print(student)
46

```

## Q10. Task Description #10 (Loops – Perfect Numbers in a Range)

**Task:** Generate a function using AI that displays all Perfect Numbers within a

user-specified range (e.g., 1 to 1000).

Instructions:

- A Perfect Number is a positive integer equal to the sum of its proper divisors (excluding itself).
- o Example:  $6 = 1 + 2 + 3$ ,  $28 = 1 + 2 + 4 + 7 + 14$ .
- Use a for loop to find divisors of each number in the range.
- Validate correctness with known Perfect Numbers (6, 28, 496...).
- Ask AI to regenerate an optimized version (using divisor check only up to  $\sqrt{n}$ )

```
28-1-2026 > Task10.py > ...
1  '''
2  write a python funcyion that displays all perfect numbers in range from 1 to 1000
3  '''
4  import time
5  def is_perfect_number(n):
6      sum_of_divisors = 0
7      for i in range(1, n):
8          if n % i == 0:
9              sum_of_divisors += i
10     return sum_of_divisors == n
11  def display_perfect_numbers():

```

## Explanation:

The basic method checks all possible divisors up to the number, resulting in higher time complexity.

The optimized approach checks divisors only up to the square root of the number, significantly improving efficiency while producing the same correct results.
